

Project Overview

This project is a web-based Rental Management System that allows users to manage rental properties, tenants, and rental payments. The system is built using Flask for backend processing and HTML for the front-end interface.

In this version (Assignment 2), we have implemented the following key features:

- Landlord Registration and Login: Landlord-type users can register and log in to the system.
- Tenant Contact Management: Landlords can add contact information for their tenants.
- Contract Upload and Signature Confirmation: Landlords can upload rental contracts and confirm the signature on contracts returned by tenants.

Project Structure

```
/Assignment-2
  /app
    /templates      # HTML
    app.py          # Entrance
    tests           # Pytest
  readme-first.md
```

How-To-Run

1. Make sure you are in the root directory of the project.
2. In the root directory, create a virtual environment by running the following command:
python3 -m venv venv

Here the second `venv` is the name of the virtual environment. You can use any name you want.

3. Activate the virtual environment by running the following command:
source venv/bin/activate

If you are using Windows, you can activate the virtual environment by running the following command:

- ```
venv\Scripts\activate
```
4. Install the required packages by running the following command:  
**pip install -r requirements.txt**
  5. Run the following command to start the server:  
**python app.py**

### ***How-To-Run-Test-Scripts (pytest)***

1. Make sure the virtual environment is activated:  
On macOS/Linux:  
**Source venv/bin/activate**

On Windows:

**venv\Scripts\activate**

2. Navigate to the root directory of the project (if not already there).
3. Run the following command to execute the test scripts:  
**pytest**
4. The pytest command will automatically find and run all the test scripts located in the tests folder.
5. Once the tests have been run, the terminal will display the results, showing which tests have passed or failed.
