How-To-Run

1. Make sure you are in the root directory of the project (where `requirements.txt` and `app.py` are located) before running the following commands.
2. In the root directory, create a virtual environment by running the following command:

python3 -m venv venv

Here the second venv is the name of the virtual environment. You can use any

name you want.

3. Activate the virtual environment by running the following command:

```
source venv/bin/activate
```

If you are using Windows, you can activate the virtual environment by running the following command:

```
venv\Scripts\activate
```

4. Install the required packages by running the following command:

```
pip install -r requirements.txt
```

5. Run the Project, start the Flask application:

```
python app.py
```

6. Run End-to-End Tests, ensure Selenium is properly configured

```
python tests\e2e_test.py
```

```
Starting End-to-End Tests...

Features to be Tested

User Registration: Test whether a new user can successfully register as either a

landlord or a tenant by submitting valid information.

User Login: Test whether a registered user can log in using the correct username and password.

User Logout: Test whether a logged-in user can successfully log out and return to the login screen.

Summary of Test Scripts

1. Testing User Registration (test_registration)

- **Purpose:** Verify that a user can register successfully by providing valid details.
- **Steps:**
 - Open the registration page.
 - Fill in the registration form with randomly generated username, phone number, email, and password.
 - Select the user type as "landlord."
 - Submit the form.
 - Check if the registration is successful and the user is redirected to a success page.
- **Expected Result:** The registration completes successfully, and the user credentials can be used to log in.

2. Testing User Login (test_login)

- **Purpose:** Ensure that a registered user can log in with valid credentials.

- Steps:
 - Open the login page.
 - Input the registered username and password.
 - Submit the login form.
 - Check if the user is redirected to the dashboard upon successful login.
- Expected Result: The user logs in successfully and is redirected to the user dashboard.

3. Testing User Logout (test_logout)

- Purpose: Verify that a logged-in user can log out successfully.
- Steps:
 - Log in and navigate to the user dashboard.
 - Go to the "My Account" page.
 - Click the "Logout" button.
 - Check if the user is redirected to the homepage and the "Login" link is displayed.
- Expected Result: The user logs out successfully and returns to the homepage, with the login link visible.
